

Dianabol for Sale | Methandienone | Methandrostenolone

Dianabol (methandienone or methandrostenolone, $C_{20}H_{28}O_2$) is an oral anabolic steroid often referred to as Dbol or D-bol. When bodybuilders and other gym rats want to build a huge amount of muscle in a very short amount of time, they most often buy Dianabol. Unlike many other common steroids, Dianabol for sale comes in oral form. This makes it a great choice among those who prefer the convenience of oral dosing or who may have anxiety when it comes to injections.

Dianabol Profile: What Is Dianabol?

Dianabol pills are highly anabolic and moderately androgenic, so they have a tremendous effect on protein metabolism. Because Dianabol for sale promotes the synthesis of protein chains and allows proteins to build up in and around the tissues, it is a favorite when it comes to adding bulk. Although it is true that some of the gains are the result of water weight, Dianabol steroids also add sheer muscle mass without a lot of fat.

Dbol reviews are usually positive, with even experienced users turning to it repeatedly for its incredible energy-providing and muscle-building properties. Although there are some Dianabol side effects of concern, most of these are mitigatable with the right supplements and a healthy diet. Because it is so incredibly powerful, only intermediate to advanced anabolic steroid users should cycle with Dbol oral.

Dianabol Dosage and Warnings

There are two main ways to buy oral Dbol. It comes in a Dbol 10mg tablet and a 25mg tablet for the more advanced user. This is one of the

most potent steroids out there, milligram for milligram, so you should titrate your dose very carefully the first time you use it. As a beginner, a 10mg daily dose is a great place to start, and you can either take it all at once or split it into a dose of 5mg taken twice per day. Most men prefer the split dose because the Dbol half-life is only about four hours, so it leaves the system quickly. If you tolerate this well, then feel comfortable to work your way up to as much as 25mg per day. Increase the dose by 5mg per day to judge your tolerance.

More advanced users may choose to use a higher Dianabol dose; it is safe up to 50mg per day. Bear in mind that exceeding Dbol 50 does not provide any further benefit in terms of performance enhancement or otherwise, and it greatly increases the risk of developing the adverse effects of Dbol. Some of these effects may be permanent, so it is best to err on the side of caution. **None of this information should replace the advice of your physician or healthcare provider. Always follow your physician's orders in terms of medications, supplements, and doses.**

Dianabol Side Effects

The side effects of Dianabol vary greatly depending on your individual tolerance, your dosage, and your stack choices. For the most part, though, healthy and fit men tend to tolerate Dbol quite well. The two most common Dbol side effects for men come from its high estrogen conversion rate. Almost all users experience some bloating and discomfort, and some men develop gynecomastia, or female breast tissue. To avoid these, be certain to

incorporate an aromatase inhibitor into your Dianabol cycle. What's more, bloating increases blood pressure due to the extra fluid in the body. To combat this, you can find many diuretics over the counter.

Dianabol for sale is always hepatotoxic, and to a very high degree. For this reason, men who have conditions that affect the liver, kidneys, or bladder should not use it. There is no real way to prevent liver damage with this product, although men are encouraged to avoid alcohol and acetaminophen two weeks before, during, and four weeks after their cycles. These increase the rate of liver damage, which may be irreversible. You should also take liver protection supplements and drink plenty of water.

Other common side effects that tend to go away on their own over time include headaches, sleeplessness, and stomach upset. If any of these become bothersome or do not go away after the first week of treatment, your body may not tolerate Dbol well. You can try diphenhydramine for sleeplessness and take Dianabol for sale with food if it causes stomach upset.

Dianabol Stack Choices

While Dbol cycles are common, most people choose to pair their Dbol oral steroids with other compounds, not only to improve their athletic performance, but also to keep themselves healthy. Aromatase inhibitors are important since Dianabol for sale converts to estrogen over time, and testosterone is necessary since your body will stop producing testosterone naturally during your cycle.

As far as stacking Dbol with other steroids is concerned, there are a few options. While testosterone is the most popular choice, you can safely pair Dbol with other anabolic steroids to a degree. The most popular Dianabol stack is Deca Durabolin since the two work incredibly well together. What's more, while many bodybuilders tend to develop tolerances to certain steroid combinations,

Deca and Dbol work well every single time you use them.

When it comes to stacking D-bol, it's important that you avoid most other oral steroids. Though there are a few exceptions, such as Trenbolone and perhaps Anavar in low doses, pairing other oral steroids with Dbol can as much as quadruple your risk of liver damage. Be sure you consider this when you plan your stacks, and stick to compounds like Deca Durabolin, testosterone, and others that do not process through the liver.

Dianabol Cycle Options

There are a few basic rules when it comes to a good Dianabol cycle. First, you should never pair Dianabol with another oral anabolic steroid. As mentioned, Dianabol is hepatotoxic, so using it alongside another hepatotoxic compound exacerbates the potential for liver damage. Research your options carefully and make sure that your cycle does not promote excessive liver damage. For instance, consider Sustanon-250. In an eight-week cycle, you would take 10mg of Dianabol for sale twice per day for a total of 20mg a day, but only for the first four weeks. Then, you would also use 500mg of Sustanon-250 a week for the entire eight weeks. This provides an outstanding basis for excellent gains of up to 15 pounds in just two months.

Next, your cycle length should relate directly to your dosage. If you choose to take Dianabol 10 mg per day, for example, you can take it for up to 12 weeks. Conversely, if you use the maximum dose of 50mg per day, your cycle should not exceed six weeks in length. Always take a break between cycles equal to the cycle length, too. For example, if you buy Dianabol and use it for six weeks, take a six-week break (at least) before using it again.

Some athletes and bodybuilders will push their doses even higher, topping out at 100mg per day. Though this is not recommended for most people, if you are experienced with Dbol and you choose to use this dose, shorten your cycle

to four weeks and take a six-week break, at a minimum.

Dianabol PCT

Dianabol for sale is a powerful, fast-acting steroid that stops natural testosterone production in its tracks. Because of this, when your cycle ends, you should incorporate post-cycle therapy to help your body start making testosterone on its own again. Most bodybuilders use Clomid or Nolvadex exclusively for 4 to 6 weeks at doses of 150mg or 40mg respectively – halving the dose during the final two weeks. If you used a high dose of Dbol during your cycle, or if you took it for more than eight weeks, you may benefit from hCG beforehand, which primes your body for the Clomid or Nolvadex.

* Remember that you should use either Nolvadex or Clomid – never both at the same time. They share equal efficacy when it comes to PCT, so you can use whichever is easiest for you to find.

** If your PCT will contain hCG, which is always a great choice after a Dbol cycle, start it 14 days after the last day of your cycle, take it for 10 days, and then move onto either Clomid or Nolvadex.

Can You Buy Dianabol Legally?

Buy Dianabol by Dragon Pharma

- Dianabol 20mg

General information:

Oral Anabolic Steroid
Active Substance: Methandrostenolone
Manufacturer: Dragon Pharma
Unit: 100 pills (20 mg/pill)

Common Names

Danabol, Dianabol, D-bol, dbol, Dianoxyl, Methanodex, Anabol, GP Methan, Methacaps, Methanabol, Methanoplex, Methandienone, Dianabolic, Naposim, Dbirol, Dianabolos.

Drug Description

Pink round-shaped pills with compact and homogeneous structure.

Dianabol Composition

1 pill contains:
Active substance: Methandrostenolone 20 mg

Bodybuilding Benefits

This is a powerful anabolic and androgenic compound used by athletes worldwide to augment the size of the muscular mass in short period of time. It supports the formation of proteins in human body, increases the bones strength and posses a slight fat burning effect. **Dianabol** has the ability to retain water and offers a positive calcium balance in bones. The drug also has a low aromatase activity.

Therapeutic Indication

It is used in medicine for the treatment of protein synthesis disorders, cachexia symptoms, healing of trauma, burns, renal insufficiency, toxic goiter, muscular dystrophy and osteoporosis. **Dianabol** is also efficient as a pre-and postoperative remedy in case of infectious diseases.

Dosage (Men)

25-50 mg per day.

Dosage (Women)

Not recommended.

Active Life

6-8 hours.

Dianabol Side Effects

Strong virilization effects (baldness, bouts of skin and body/facial hair growth), water retention related processes, acne vulgaris on the neck, chest, back, or shoulders in cases when sebaceous gland function is stimulated, mood swings, oily skin and liver disturbances.

Dianabol Contraindications/Precautionary Measures

Not recommended in case of hypersensitivity to the medication, severe atherosclerosis, hepatic and renal function, acute and chronic prostatitis, prostate cancer, breast cancer in men, breast carcinoma in women with hypercalcemia, pregnancy and lactation. May cause strong virilization effects such as deepening of the voice, facial or body hair growth, acne. It is recommended to monitor the levels and conditions of lipidemia and cholesterol during the use of the compound.

Overdosage

There are no registered cases of overdosage.

Dianabol Stack/Cycle

Usual length of the cycle - about 6-8 weeks. To stimulate muscle building process it is stacked with Duraxyl 100 and Enantat 250 as well as Stanoxyl and Oxandrolone compounds, to avoid water retention and with antiestrogen medications like Proviron, Anastrozol or Nolvadex.

Package Presentation

20 mg pills.

Storage

To be store in a dry place, protected from light, at a temperature of 15-25 ° C. Keep out of reach of children.

There is no legal Dianabol in the United States since it is no longer FDA approved to treat medical conditions. In Mexico, however, it is readily available over the counter without a prescription. Despite the fact that US-based companies produce shipments of injectable Dianabol daily for shipment to other countries, most of the steroids you find in the US comes from Mexico, and it comes as Dianabol tablets. The use, possession, sale, and purchase of Dianabol are illegal in the US. If you choose to use it, consider the potential legal implications beforehand.

Buy D-bol Pills | Dbol For Sale | Dianabol

Not all steroids are dangerous or illegal, and one of the best supplements you can take to increase your strength and muscle mass is Dianabol. It's sometimes called other things; dbol, d-bol or dbal are all terms used to describe this muscle producing steroid that's safe to use and completely legal to incorporate into your weight training and fitness routines. It's almost as old as testosterone, and just as effective in helping athletes, professional bodybuilders and even amateur weightlifters interested in building their mass, increasing their strength and achieving a better physical form. After a lot of testing and adjustments, this anabolic steroid has become one of the most popular and effective substances on the market.

Oral Form: Dbol Pills

The best way to take Dianabol is by mouth. The oral form of this steroid ensures it works fast and hits the blood stream immediately. When you're considering how to buy dbol, make sure you look for the pill form if you want the best, fastest results possible. You can buy d-bol pills in your favorite retail store, or look for great deals online. If you're interested in stacking, try this one with others such as Decadrolone, T-Bal 75 and Testosterone-MAX.

How Dianabol Pills Work

If you're wondering how dbol is able to provide such fast, effective results, it's due to the ingredients and the way your body responds to them. This steroid boosts your stamina and your energy level, allowing you to workout longer and with more intensity than ever before. It enhances your body's ability to retain nitrogen, which helps your muscles use protein to create an ideal environment for growth and power. When you have a positive nitrogen balance, you have achieved an excellent state for muscle growth. The dbol helps you get there.

With everything working right in your muscles, you will achieve lean muscle mass, and you'll achieve it quickly. The Dianabol will also permit for better blood flow while you're exercising. This means that whether you're lifting, running, swimming or boxing, the blood is circulating through your muscles the way it needs to, bringing oxygen to your brain and your organs in healthy ways. Your workout will not only be longer and stronger – it will be more productive. You'll also find that you're more focused and driven. It's easy to stay motivated when you're taking dbol, because everything is working together smoothly to give you results that are even better than you anticipated.

Why Buy Dianabol?

It's always a good idea to do your research before you buy. There are many benefits to taking this supplement when you're trying to achieve optimal physical and mental health. For starters, it's a lot safer than some of the pure anabolic steroids you'll find on the market. The side effects aren't nearly as extreme and you won't have to worry about putting your health in danger. It's also completely legal. There is no reason to worry that you'll get into trouble or have a hard time explaining what's in your system.

Another good reason is that dbol pills are easy to swallow. There are no needles or complicated procedures for taking this supplement. Take it with a glass of water, and you're all set. There's nothing to inject. You

don't need a prescription, either, which is helpful. It's a huge benefit to be able to take your own health and wellness strategies into your own hands. As long as you use the recommended amounts and you take it in its proper dosage, you don't have to undergo physicals or endless visits to the doctor in order to take your d-bol pills.

Another major benefit is that when you find d-bol for sale online, you can have it shipped to you wherever you are. Whether you're in the same town or across the world, you'll receive the supply you ordered in a reasonable amount of time and for a reasonable shipping charge. The packaging it arrives in is neutral and discrete, and you won't have to worry about chasing down this product on your own. Simply click on what you want, enter your payment and shipment details, and then wait for it to arrive. Buying dbol for sale has never been easier.

How to Use Dianabol Pills

Once you get your supply, you might have questions about how to effectively take them. Fortunately, you'll get all the assistance and education you need with your pills. For the best results, take one tablet three times every single day. This is the recommended dosage. You want to take it every day, even when you're not working out. Make sure you take it with food so it can be digested appropriately. Scheduling it around your meal times is a great way to make sure you're taking it consistently and at the best times. On the days that you will be working out, experts suggest you take the pills about half an hour before you start training. There's no waiting for results. You'll notice a difference almost immediately.

Dianabol Reviews

Before you buy dbol, you'll probably want to know what other users are saying about it. You can find a dianabol review in a number of places online, particularly through retail sites that sell the product. You can also talk to people who take it and find out what kind of

results they're experiencing. Most people who use this steroid are pleased with the changes they see in their strength, muscle tone and workouts. You'll have the capacity to do more. People who use this supplement are quick to point out that they notice a big difference, especially when they take it as directed for about two months.

Gaining muscle and mass is important to everyone who takes this product. There are lots of supplements out there claiming to bring you dramatic results with very little effort on your part. If you want a serious substance boost, read the dbol reviews and then try it yourself to make up your own mind. You'll be able to shed the body fat, build up the lean muscle mass and increase your endurance and stamina as you workout. Your performance will receive a boost inside and outside the gym, and you'll be glad you gave it a try. When you start working with dbal, you'll make noticeable improvements to your fitness schedule to bring about obvious results. There will also be a noticeable change to your body, and that's not something that will be easy to hide. Everyone will want to know what you're doing and what you're taking. Don't be afraid to share the good news and develop your own dbol review for this outstanding product.

Now that you have had a chance to examine the dianabol for sale, there's no reason not to give it a try. This is the most powerful and effective steroid on the legal market, and when you stack it and combine it with an excellent diet and workout plan, you'll be completely unstoppable. Order your first shipment and see what happens in the first few weeks that you begin taking it. Your muscle and mass cannot wait; sign up for a supply right now and see how far it takes you.

Oral Methandrostenolone

Steroid by Gen Shi Labs

Dianabol

General information:

Manufacturer: Gen-Shi Laboratories, Japan

Substance:

Methandrostenolone/Methandienone

Package: 30 tablets (10 mg/tab)

Common Name(s): Danabol, DBOL, Methanabol, D-BOL, Methanabol, Methanodex

Dianabol by Gen-Shi Laboratories

Dianabol is the trade name for the synthetic steroid released by Gen-Shi Laboratories. Dianabol 10 mg is intended for oral administration and is produced as 10 mg tab.

Each tablet of Dianabol 10 contains 10 mg of **Methandrostenolone** (Methandienone) hormone, and can be used both in men and women.

Dianabol 10mg is commercialized in a blister with 30 tablets.

Methandienone is an anabolic steroid banned from use by FDA under controlled substances act. Dianabol has been very popular in bodybuilders until its ban to increase strength and volume of their muscles. Dianabol acts strongly on androgen receptors and exerts its effects by protein synthesis and glycogen breakdown to increase muscle mass in short space of time. Dianabol produces estrogen as end product so water retention is also one of the contributors towards weight gain and increased volume. Dianabol effective dose is 15-50 mg/day in men and its active life is 6-8 hours. Dianabol is excreted through kidneys and detection time in urine is 5-6 weeks. Until the ban Dianabol has been used as tonic by bodybuilders. Probably, Dianabol is effective in treatment of senile postmenopausal osteoporosis. Dianabol was also recommended in those individuals who are suffering from condition called pituitary deficient dwarfism. Dianabol was also used in those individuals who have weakened bones and always complain for exhaustion after small running and prolong walking. Still, Dianabol is prepared in large quantity in those countries where drugs

regulations are weak and is used in human as well as in veterinary patients of the conditions described above.

Dianabol Side Effects

There are several side effects of this steroid such as Gynecomastia is always concerned in the patients use this regularly. Skin could become oily and hairs can grow on face and body. Virilization of the female such as deepness in the voice, irregularities in the menstruation, alteration in the texture of the female skin and enlargement of clitoris may occur by its usage. Prolong intake to this medicine may lead to hepatotoxicity.

Dianabol Effective dose: 10 - 100 mg per day.

Dianabol

(Methandrostenolone)

Dianabol represents one of the most popular and one of the most important anabolic steroids of all time. Without question, this is the most popular oral steroid to ever hit the market and one of the most popular steroids in any form. While almost always found as an oral tablet, Dianabol can be found as an injectable solution, but the tablets represent the primary route of administration. Why is this steroid so important? In many ways it gave birth to the age of modern performance enhancement. It was not the first anabolic steroid used for that purpose, that would belong to testosterone, but Dianabol would open the door to a new wave of steroid use that has grown beyond what anyone expected.

Dianabol represents one of the only anabolic steroids that was developed for the sole purpose of performance enhancement. The compound did carry listed therapeutic uses at one time, but performance was the true reason this steroid was given life. Through the 1940's and 50's the Soviet Union had begun to

dominate the Olympic games, and the use of testosterone by many of its athletes left the rest of the world lagging far behind. During this time, U.S. Olympic team Dr. John Ziegler would learn of the U.S.S.R.'s steroid use, and quickly would aid in ensuring his athletes would match up. In 1958, with the help of Dr. Ziegler, Ciba Pharmaceuticals would release the first batches of Methandrostenolone under the trade name Dianabol. The compound was designed in an effort to maintain the anabolic properties of testosterone with less androgenicity in a fast acting, powerful method. Seemingly overnight the steroid was a massive success, giving many U.S. athletes a distinct advantage over their Soviet rivals.

After its inception, Dianabol would quickly find its way into nearly every competitive sport imaginable. In conjunction with exogenous testosterone, this would birth an age of performance unlike the world had ever seen. The steroid would also rapidly become a staple in competitive bodybuilding where it has remained a favorite to this day. However, shortly after its release the U.S. FDA would begin to put a lot of pressure on Ciba in an effort to push the company to list true medical benefits of the steroid. The FDA would approve its use for the treatment osteoporosis in post-menopausal women as well as pituitary-deficient dwarfism, but the latter was withdrawn in the early 1980's. Again the FDA would pressure Ciba for more information, but in 1983 under mounting pressure Ciba would discontinue the Dianabol tab. A few years later, the FDA would pull all Methandrostenolone brands from the shelf. Since that time Dianabol has not been legally manufactured in the United States, but is still manufactured heavily all over the world.

Dianabol Functions & Traits:

Methandrostenolone is a testosterone derived anabolic androgenic steroid. Officially, it is a structurally altered form of the primary male androgen testosterone. Dianabol is the testosterone hormone with an added double bond at the carbon one and two position. This

slight alteration reduces the hormone's androgenic nature. It also carries an added methyl group at the 17th carbon position that allows the hormone to survive oral ingestion, officially classifying Dianabol as a C17-alpha alkylated steroid. An important note, injectable Dianabol is also C17-alpha alkylated. The end result gives us an anabolic steroid with an androgenic rating of 40-60 with a much lower binding affinity to the androgen receptor compared to testosterone. However, it will also share a much weaker relationship for serum binding protein, which results in an extremely powerful anabolic steroid. If there's any doubt, this is one extremely powerful anabolic steroid carrying a potent anabolic nature.

On a functional basis, Dianabol is one of the easier anabolic steroids to understand. This steroid will largely provide its anabolic benefits by enhancing protein synthesis, nitrogen retention and glycogenolysis. Protein synthesis represents the rate by which cells build proteins, the building blocks of muscle. Nitrogen retention, this is important as all muscle tissue is comprised of approximately 16% nitrogen. The more nitrogen we retain, the more anabolic we remain. Conversely, a nitrogen deficiency results in a catabolic or muscle wasting state. Then we're left with glycogenolysis, which refers to the relationship and conversion between glycogen and glucose. Through enhanced glycogenolysis, we are able to make better use of our total carbohydrate consumption. While in many ways these traits are quite simple, they are strong enough to make Dianabol a remarkably powerful anabolic steroid.

Another important trait of Dianabol and perhaps one of the most important of all is the relationship it shares with other anabolic steroids. Dbol as it's often called is not what we'd label as a base steroid. This is not an anabolic steroid we build a cycle around, but rather one we add to a well-planned stack. Dianabol has the ability to create unbelievable synergy when conjoined with other anabolic steroids. For example, you could supplement with 100mg

of Trenbolone, Masteron or Equipoise per day (doses and steroids are simply being used as an example, not actual recommendations) and the results you'd receive from 50mg per day of Trenbolone, Masteron or Equipoise along side 50mg of Dianabol per day would be far more dramatic. You would have an identical amount of total milligrams of anabolic steroids with or without Dianabol, but the added Dianabol would provide greater enhancement.

Effects of Dianabol:

The effects of Dianabol can be summed up as fast acting and dramatic. In fact, it is more than possible for the individual to gain as much as 20lbs of mass in only a few weeks of Dianabol use. Total dosing will play a role, as will total caloric consumption, but a 20lb gain is very realistic. This makes Dianabol a premier off-season bulking steroid, and that will be its most common purpose of use. During this phase of use, the individual should also expect his strength to increase significantly. Dbol is actually one of the best strength increasing steroids on the market and along with mass can produce this result rapidly.

The effects of Dianabol are also greatly appreciated by many athletes; however, it is not as common as it once was in athletic enhancement circles. Due to the possible rapid increases in mass, many athletes will opt for steroids like Anavar or Winstrol, but it generally depends on the purpose of use. Due to the rapid and pronounced increases in strength, which can translate into more power and speed, this can be a solid athletic enhancer. The individual should also experience a level of enhanced recovery and endurance. When it comes to the weight gain, it's important to remember that this will largely revolve around total caloric intake. While the steroid can promote enormous amounts of mass, you have to feed the body enough calories to reach this end. We wouldn't call this the best athletic enhancing steroid due to other options, but if strength is the only true concern it could be a decent option.

Then we're left with the cutting cycle, and you will not find Dianabol in such plans too often. Some competitive bodybuilders will use it early on in a cutting phase in order to maintain fullness, and it will provide lean tissue protection; however, there are better options. One problem with cutting cycle use can be the level of water retention this steroid can provide, which is normally the last thing you want when cutting. Such retention can be controlled, and the ability for this steroid to maintain strength can be appreciated, but there are better options.

Side Effects of Dianabol:

There are several possible side effects of Dianabol use. This is not the most dangerous anabolic steroid of all time, but it can carry a host of potential problems. A healthy adult male can manage the side effects of Dianabol, but you must understand them and how to combat them to pull this off. In order to achieve successful supplementation, we have broken down the possible side effects of Dianabol into their related categories along with all you need to know:

Estrogenic:

Dianabol is a relatively strong estrogenic anabolic steroid due to the moderate level of aromatase activity it carries. While its aromatase activity is only moderate, this conversion actually leads Methandrostenolone to be converted to methylestradiol rather than estradiol, which is far more powerful than estradiol. This can make side effects like gynecomastia and water retention very possible with this steroid; in fact, they can appear seemingly overnight. Heavy water retention can also promote high blood pressure, which Dianabol is notorious for causing. Such effects can be controlled, and when it comes to high blood pressure this is something you'll need to put some effort into ensuring does not become a problem.

In order to combat the estrogenic side effects of Dianabol, anti-estrogens are commonly

recommended when supplementing with this steroid. You have two choices in anti-estrogens, Selective Estrogen Receptor Modulators (SERM's) like Nolvadex (Tamoxifen Citrate) and Aromatase Inhibitors (AI's) like Femara (Letrozole). SERM's can be enough for some men and should be your first choice if they can get the job done. However, AI's will be far more effective as they will directly inhibit aromatization and reduce serum estrogen levels. Unfortunately, AI's can negatively affect cholesterol, as can Dianabol, and when conjoined this can prove potentially problematic. If an AI is used cholesterol management will be a priority, and it will be possible. However, SERM's, while not always as effective will actually promote healthier cholesterol levels due to their estrogenic like activity in the liver.

Androgenic:

Dianabol is not an extremely androgenic steroid, its androgenicity has been structurally reduced, but androgenic side effects are still possible. Such side effects of Dianabol use include acne, accelerated hair loss in those predisposed to male pattern baldness and body hair growth. Most men should not have a problem with such effects, response will be the final dictator, but most will remain clear. Although the odds are in your favor, such effects are brought on by Methandrostenolone being metabolized by the 5-alpha reductase enzyme. This is the same enzyme responsible for the reduction of testosterone to dihydrotestosterone, but the overall conversion here will result in very low amounts of dihydromethandrostenolone. This tells us 5-alpha reductase inhibitors like Finasteride that are often used to combat androgenic side effects will have very little if any affect on Dianabol.

Despite its reduced androgenicity, Dianabol can promote virilization symptoms in women. Such symptoms include body hair growth, a deepening of the vocal chords and clitoral

enlargement. It is possible for some women to use this steroid without virilization symptoms with extremely low doses, but the odds are not favorable. Most all women should choose anabolic steroids with less translating androgenic activity to meet their needs.

Cardiovascular:

Dianabol can have a pronounced negative effect on cholesterol. This includes HDL cholesterol suppression and increases in LDL cholesterol, and the total changes can be significant. It is possible for total cholesterol levels to remain in a healthy range, but it is also possible for this healthy total reading to be misleading if HDL is suppressed heavily. Managing cholesterol during Dianabol use will be extremely important. Repeated use of this steroid as with many anabolic steroids could potentially lead to plaque buildup in the arteries overtime. It's also extremely important to keep in mind the very possible additional strain on cholesterol brought on by the use of an AI when supplementing with Dianabol as total estrogen reductions will have a negative effect. Again, cholesterol maintenance will be extremely important.

As discussed, Dianabol can also play a negative role on blood pressure, which can be controlled by controlling water retention in most cases. When it comes to the blood pressure and cholesterol issues, the ultimate key to success will be your lifestyle. You should not supplement with this steroid if you already suffer from high blood pressure or cholesterol. If you are healthy enough for use, you should ensure your lifestyle is conducive to their maintenance. This should include a healthy diet that is rich in omega fatty acids, plenty of cardiovascular activity and an avoidance of any activity that promotes the opposite, negative end. Proper estrogen maintenance and control will also be important as estrogen plays an important role in cholesterol management. Yes, it is more than possible to supplement with

Dianabol without high blood pressure and cholesterol, but you must put in the effort.

Testosterone:

All anabolic steroids suppress natural testosterone production. While the total rate of suppression varies from one steroid to the next, with Dianabol it is very pronounced. For this reason, most men are encouraged to include some form of exogenous testosterone with their Dianabol use. Failure to include exogenous testosterone, regardless of your genetics or rumors you have heard will lead to a low testosterone condition. Such a condition comes with a host of possible symptoms and is extremely unhealthy. Even if symptoms do not show or are moderate at best, a low level condition will remain an unhealthy one. If you include exogenous testosterone, this problem is solved as the body will have all the testosterone it needs.

Once the use of Dianabol is complete and all the exogenous steroidal hormones have cleared your system, natural testosterone recovery will begin again. Natural recovery assumes no prior low testosterone condition. It also assumes no damage was done to the Hypothalamic-Pituitary-Testicular-Axis (HPTA) due to improper anabolic steroid use. While natural recovery will begin on its own, it will be slow. For this reason, most are encouraged to implement a Post Cycle Therapy (PCT) plan after anabolic steroid use. Such a plan will commonly include the SERM's Nolvadex and Clomid, and often additional HCG. This will greatly speed up the recovery process, as well as its overall efficiency. It will not return your natural testosterone levels to normal on its own, if this is something you've been told it is a myth. However, it will ensure you have enough testosterone for proper bodily function while your levels continue to naturally rise. Total recovery will still take several months, but this will cut the total time down dramatically and ensure a smooth recovery.

Hepatotoxicity:

Dianabol is a C17-alpha alkylated anabolic steroid, and as a result, carries a hepatotoxic nature. The rate of hepatotoxicity can vary greatly from one C17-aa steroid to the next, and while Dbol is far from the most toxic, we can't call it mild either. However, its total toxicity should not lead to liver damage if responsible use is followed and the liver was healthy to begin with. During use, liver enzyme values will increase, but it's important to remember increases in values does not equate to damage but rather stress and potential damage. In order to avoid damage, use should be limited to 6 weeks of total use. There should also be at least 6 weeks of no C17-aa use before beginning a new course. However, most will not begin a new course until their next cycle.

In order to provide protection, beyond duration of use recommendations there are several points of consideration. When using a C17-aa steroid like Dianabol, it is extremely important that you avoid excess alcohol consumption, as excess will promote tremendous liver stress. In fact, avoiding all alcohol isn't a bad idea. If that's not appealing, keep in mind alcohol is perhaps the most anti-performance substance we can put in our body, and your total purpose of Dianabol use is performance enhancement.

Beyond alcohol, you should also avoid all over the counter (OTC) medications when possible. Many OTC medications carry strong hepatic natures, and in some cases, far more pronounced than many anabolic steroids. Use should be limited to when only absolutely necessary. Once all C17-aa steroid use has come to an end, liver detoxifiers supplements are also recommended.

Dianabol Administration:

Standard Dianabol doses will vary tremendously depending on experience and individual desires. Despite internet rumor and

myth, a quality Dbol tablet will produce notable results with as little as 15mg per day. However, most will be far more satisfied with a 20-25mg per day dosing. Keep in mind, each time we increase the dose, this increases the probability of negative side effects and makes them more difficult to control. If a positive experience is enjoyed in the 20-25mg range, 30-35mg per day can be attempted if desired. 50mg per day would be the next step up, and that's a big Dianabol dose, but manageable for the experienced anabolic steroid user. However, many will not need such a dose. Higher doses are not uncommon in some hardcore circles, you can easily find someone taking up to 100mg per day, but such doses cannot be recommended. Doses of this nature will produce side effects and be hard on your health. Even if you can control the visual side effects with such a dose, the internal effects can be a very different story.

Dianabol carries a half-life of 3-5 hours, and many often recommend splitting the daily dose into 2-3 small doses per day in an effort to maintain peak blood levels. However, even with 3 equal doses per day, you will still experience highs and lows in blood levels. Further, the maximum peak blood level will be much lower than it could have been if the total dosing was taken all at once. By taking the total daily dose at once, this will give you a higher peak level that you can time around your training and maximize during the crucial timing window that follows training. Regardless of which method you choose, you will find Dianabol to produce great results.

The final note on Dianabol administration is when to take it during a cycle. The most common point of use is as a kick-start to a new off-season mass gaining cycle. This will give the individual fast and notable gains early on while the slower injectable steroids are building in their system. This type of use will also result in the most dramatic gains in weight. Another option of use is mid-cycle during a period often referred to as plateau busting. During any cycle you will hit a wall and the gains will slow or come to a screeching halt. Introducing

Dianabol during this phase will see you break through the plateau or sticking point, and your progress will continue. Due to the hepatotoxicity of Dbol, and due to the fact that most cycles will fall in the 8-12 week range, most will only use Dianabol for one of those purposes during a single cycle. However, in hardcore bodybuilding cycles that often extend well past the 12 week mark, it would be possible to implement both phases of use with necessary C17-aa breaks. Regardless of the type of use, dose or timing schedule you use, you will find Dianabol stacks well with all anabolic steroids. But it should not be used with another C17-aa anabolic steroid.

Availability of Dianabol:

Dianabol is one of the most widely available anabolic steroids on earth. You will not find a steroid supplier that doesn't carry this product. This includes all online steroids suppliers, and should include any local gym dealer. As an added bonus, this is one of the most affordable steroids on earth. Demand is high, but so is the supply and competition, and this keeps the price down. In fact, you can easily buy 1,000 5mg British Dispensary Anabol tablets, one of the most common and notable brands on earth for as little as \$100. Other popular brands include Russian Dbol МЕТААРОСТЕРОРОН by Akrikhin (Akpxnh), Naposim by Terapia and Anahexia by Jinan Pharmaceuticals. You will also find numerous underground labs carry high dose Dianabol capsules. Most Dbol tablets will normally be found in 5mg and 10mg strength, but capsules are common in 25-50mg strength. Unfortunately, while there are some good capsules, many of them are garbage. Sticking with tablets is normally the best way to go, and they shouldn't cost that much.

A final note on the availability of Dianabol, while there is an abundant amount of high quality Dbol, counterfeits do exist. Researching your supplier is imperative before making a purchase. This research should also include digging up all information on the Dbol brand of your choice before making a purchase.

Buying Dianabol Online – Warning:

Buying Dianabol online is the easiest way to purchase the steroid, and by far the most affordable. While a gym dealer is convenient, in most cases his prices will be much higher. Most gym dealers are buying Dianabol online themselves and then passing it on to you. While online purchasing is common, it also comes with potential problems. You could be scammed, you could buy a low grade product or you could end up with an outright counterfeit. This makes researching your supplier first hand again imperative. However, there is one more concern that is far greater and will not change regardless of how much research you do. In places like the United States, buying Dianabol online is against the law and a violation of federal law. In the U.S. anabolic steroids are classified as Schedule III controlled substances. You must have a prescription to legally purchase and possess anabolic steroids, and a prescription will only be given on the basis of what's considered legal medical need. Even if you qualify for a prescription, you will not receive one for Dianabol.

The laws regarding anabolic steroids can vary greatly depending on the country in question. There are several countries that are similarly strict to the U.S. but the U.S. is about as strict as it gets. At the same time, there are many countries that are far more lenient when it comes to anabolic steroids. However, most countries will frown on online purchasing. Regardless of where you live, understanding the law is it pertains to where you live is important. But if you're looking for high quality anabolics and you want to guarantee your legal safety, you are encouraged to visit the sponsors here at our site. The sponsors here at site can legally provide you high quality anabolics without a prescription or the need for legal concern.

Dianabol Reviews:

Dianabol is simply a fantastic steroid, there's really no other way to put it. It's a very simple anabolic steroid, very basic, but like so many

things in life sometimes basic can be tremendous. If you're looking for rapid gains in size that give you a full look, this is the steroid for you. If you're stuck in a rut and your progress has hit a wall, again this is the steroid for you. There are steroids that can produce similar fast acting results. The anabolic steroid Anadrol (Oxymetholone) is most commonly compared to Dianabol in this regard; however, its potential for negative side effects is greater than Dianabol. Many argue that Anadrol is stronger, but many often use doses of Anadrol much higher than Dbol. Some data has suggested that on a milligram for milligram basis, Dianabol is actually the stronger steroid.

Regardless of its total level of power, which all will agree is high, Dianabol's place in the history of anabolic steroids is an important one. Athletes have always strived to be the best, and enhancing performance has always been a pursuit. Injecting testicular extract to eating raw animal testicles themselves have all been a part of sports; the latter since sports existed. However, it would be Dianabol that would bring forth the modern age of performance enhancement and the realization of what anabolic steroid use could do in a performance capacity. Oddly enough, for decades those that have supported steroid bans have touted there's no proof Dianabol actually enhances performance. In fact, there have been official write-ups making this claim. Anyone who has used the steroid knows how ridiculous this is, and if it weren't it wouldn't be one of the most sought after anabolic steroids in the world for more than 50 years.

Dianabol for sale | Buy Dianabol pills

Buy Dianabol - 100 tablets each contains 10 mg Methandienone

- Pharmaceutical Name: Methandrostenolone/methandienone
- Chemical Names: 17a-methyl-17b-hydroxy-1, 4-androstadien-3-one 1-

Dehydro-17a-methyltestosterone methandienone

- Molecular Weight: 300.44
- Formula: C₂₀H₂₈O₂
- Melting Point: 159-164 degrees Celsius
- Active Life: 3-8hours
- Detection Time: up to 6 weeks
- Anabolic/Androgenic Ratio (Range): 90-210:40-60

Methandrostenolone has long been a favorite of strength athletes and bodybuilders since its creation in 1956, with the explicit purpose of its creation being for the use by athletes. It was the compound's ability to promote drastic protein synthesis, stimulate strength in a direct and fast-acting way, and its ability to enhance glycogenolysis that made it so popular, and why its popularity remains high today.

In terms of its medical use, Dbol pills was/is used in the treatment of conditions such as interstitial-pituitary insufficiency, chronic adrenocortical insufficiency, thyrotoxicosis, diabetic angiopathies (retinopathy and nephropathy), steroidal diabetes, and pituitary dwarfism among others (1). However, due to the U.S. Food and Drug Administration's belief that the compound was being used inside of the bodybuilding community far more than in the treatment of medical conditions, it ordered that American companies discontinue its manufacture in the early 1990's. Numerous drug companies outside of U.S. borders continue to make the drug, however, and its prevalence on the black market has remained very high.

Use/Dosing

It can be concluded that the best use for Dianabol pills is short-term with most users preferring to use the product for between four to six weeks, although some will prolong the use with limited consequences to health, despite its strong hepatotoxic effects. For the most part, most recreational users begin administering methandrostenolone at the start of a longer bulking stack to "jumpstart" gains in mass and strength. However, it's used prior to

various sorts of competitions is also quite common so that its effects are realized during a specific period.

Due to the active life, which is three to eight hours, multiple doses throughout the day of methandrostenolone should be utilized. It is best to maintain blood levels as evenly as possible, therefore dividing doses throughout the day at even amounts is required. Some argue that administration of the drug should cease a few hours before you sleep as it will cause further HPTA shut down, as the body's natural testosterone production during sleep could be affected. However, if you are taking other compounds along with methandrostenolone, these will already be shutting down your natural testosterone production, therefore this is not a concern. In terms of dosing, it has been reported that doses of 10 mg can increase androgen activity by five times, as well as have an effect of a 50 to 70% decrease in cortisol activity (2). Despite this, the majority of anecdotal evidence suggests that twenty to forty milligrams are the norm in terms of first-time users (as ascertained from the anecdotal knowledge gleaned from various users). However, doses ranging from 100-150mg and higher have been reported by some experienced users. As with the majority of anabolic drugs, the returns are seemingly diminished and the likelihood of side effects increase as the doses do.

Similar to nearly all oral steroids, the vast majority of users will recognize the fact that methandrostenolone should not be run alone and only stacked with other compounds. This is due to the fact that most users who have run methandrostenolone only cycles have reported anecdotally that it is extremely difficult to maintain gains post cycle. However, the same is true when discontinuing the drug and having your other compounds "kick in", if they are a long ester. It is often the case that the water retention experienced while on methandrostenolone will be shed but the gains in strength and mass will remain due to the other compounds being present. It can be argued that therefore, the gains experienced while on methandrostenolone are short-lived no matter what the circumstances and the compound should only be used as a quick fix for either competition or else simply as a motivator while waiting to notice the effects of long ester compounds. However, others will argue that the gains they make while using the compound are indeed maintainable. Therefore, personal experimentation is once again the only way to see how an individual reacts.

Risks/Side Effects

Estrogenic side effects can be a concern with methandrostenolone, as it converts to estradiol via aromatase, although this is quite modest at best. High blood pressure, water retention, gynecomastia, and acne are all possible undesirable side effects during use of Dianabol. As an aside, a high number of users have also reported experiencing nose bleeds while using the compound. Some attribute this to an increase in blood pressure, while others have not noticed a rise in their blood pressure but still experience an increase in the number of nose bleeds they have while using methandrostenolone.

Use of an aromatase inhibitor such as Arimidex or estrogen blocker such as Nolvadex should help to counteract some of these side effects. As for potential hair loss, the androgenic metabolite 5-alpha dihydro methandrostenolone is only produced in trace

amounts, and therefore hair loss should not be a concern(3). In women, it is not uncommon for virilizing side effects to occur, including increased growth of androgen-sensitive hair and deepening the voice, amongst others. There are no ways to minimize these side effects in women if they are experienced other than to keep the dosage that one is taking to a minimum.

Like most oral steroids Dianabol is 17-alpha-alkylated so that it can't be broken down into a 17-ketosteroid, and therefore rendering the substance ineffective. However, this causes liver values to become elevated over a short period of time. It is for this reason that long-term use of any 17-alpha-alkylated steroid is considered dangerous. Despite this, however, no long-term damage should be expected if use is kept to relatively short periods, with liver values returning to previous levels after use is discontinued in nearly all cases (4).

It should also be noted that Dianabol may be less useful to those competing in aerobic events as it also diminishes cell respiration(5). This may inhibit an individual's ability to perform at their maximum capacity.

Bridging with D-Bol: Is it possible?

A widely held belief among some in the steroid using community is that a small dose of methandrostenolone can be used to "bridge" between cycles. This is due to the fact, as explained above, 10mg taken at once will increase your average testosterone level by five times and decrease your endogenous cortisone by 50-70%. This, along with the short active life of the drug, would suggest that by using a small dose first thing upon waking is thought by some to help to combat the problems associated with coming off of anabolic steroids. By coinciding the dose of Dbol with the body's own natural testosterone spike upon waking, many advocates of "bridging" will suggest that the body will somehow be fooled into believing that this

spike is natural and that LH function will remain only partially suppressed, as methandrostenolone has a comparably small influence on the natural endocrine system(6). The usually suggested dose for bridging is usually 10mg per day.

Despite appearances, this theory has very little evidence to back itself up with no real scientific evidence to suggest that a bridge is even possible, although granted that the majority of our working knowledge comes through trial and error. However, even the proponents of a "d-bol bridge" admit that complete restoration of LH function will not be achieved until one is completely off of all compounds. With that said, it is unlikely that a "bridge" will help to maintain muscle mass while you are able to recover both HPTA and LH function. The only solution is to come completely off all substances and run a proper post-cycle therapy.

Dbol is an effective steroid, however, it uses must be directed at a specific goal as like most compounds it's used only fulfills a limited amount of desired effects. With this in mind, methandrostenolone can be used safely and effectively.

Buy Dbol - Danabol - Methandienone injectable for sale

POWERFUL SOLUTION
CHANGING RULES

First synthesized in US by the American scientist John Ziegler in 1956 and released early in the 1960s by Ciba Pharmaceuticals.

Methandienone profile

Chemical name: (17a-methyl-17b-hydroxy-1,4-androstadien-3-one)
Formula: C₂₀H₂₈O₂
Molecular weight: 300.44
Release year: 1960s
Anabolic activity index: 200% of testosterone
Androgenic activity index: 50% of testosterone

Aromatization: high
Hepatotoxicity: yes
Route of administration: oral, injectable
Effective methandienone dosage: 20-40 mg/day
Active half-life: 5-6 hours
Detection time: up to 6 weeks

Benefits:

rapid muscle bulking because of protein synthesis and glycogenolysis acceleration;
significant power performance enhancing;
appetite increasing;
skeletal system, joint and ligaments strengthening;
erythropoietin synthesis promoting.

Possible methandienone side effects:

increased load on the liver;
side effects typical for estradiol;
adverse impact on the lipid profile;
alopecia;
acne;
virilization in women.

Methandienone (methandrostenolone, Dbol, dianabol) is a derivative from testosterone, one of the most popular steroid compounds in the world and the second steroid (after testosterone) ever produced. The original compound manual stated that one 10mg tablet of methandrostenolone per day was sufficient to completely replace endogenous androgen production for a man. Hence, Dr. Zeigler advised to take 5 to 10 mg per day. It was the dosage, which bodybuilders allegedly used for muscle growth from then until roughly speaking the 1970-ies. Nowadays you can buy methandienone (dbol) usually in tablet form, though our online shop offers also a specialty for sale: injectable methandienone. It has higher bioavailability, which means lower dosages and less hepatotoxicity!

Methandienone very significantly affects metabolism, namely boosts protein synthesizing in the organism. In this context, for the maximum efficiency it is necessary to ensure intake of high protein amounts (2.5-3 grams/kg of body weight daily) during methandienone administration. Until today methandrostenolone is one of the most potent steroids for muscle bulking.

The half-life of methandienone is about 5-6 hours, so, in order to get continuous effect, we recommend evenly distribute Dbol tablets or pills during the whole day. This will cause a lower peak blood level than if methandienone tablets were taken all at a time, but the action will last longer, what is probably more crucial.

Interestingly, Dianabol has an identical chemical structure as boldenone, only that it has the added c17-alpha-alkyl group discussed below. This makes these

steroids to act in two very different ways. The main difference consist in the disposition for estrogenic side effects, which is much more expressed with methandienone. You must be beware, that methandienone aromatizes easily into methylestradiol, which is by 30% more active compared against regular estradiol. Therefore, gynecomastia is a real concern during administration of Dianabol, and may appear quite early (particularly when higher doses are taken). The next side effect is water retention, which causes loss of muscle definition. That's why athletes shall keep estradiol level under control by using aromatase inhibitors, preferably anastrozol. Methandienone (Dbol) can also bring to other side effects typical for all steroids: oily skin, acne, body/facial hair growth, prostate enlargement, alopecia.

For methandienone is a relatively pronounced "rollback phenomenon" after the cycle competition typical, which can be explained by loss of functional fluids, which had been retained during the cycle.

Methandienone suppresses, as any other steroid, the endogenous testosterone production, so after the cycle had been finished, the body is overtaken by so-called post-cycle crash. To get out of that as quickly as possible and to restore the regular levels of endogenous hormones, it is highly recommended after each cycle of methandienone (dbol) to carry out the post-cycle therapy (PCT) based on anti-estrogens.

Recommended methandienone cycle duration is no longer than 6-8 weeks.

Pharmacom Labs managed to create an injectable version of this well-known compound! Due to the missing pass through the liver it has higher bioavailability as compared against the oral version. As per feedbacks of our numerous customers 30 mg of Pharmabol 100 as judged by feelings and increase in strength and muscle mass are equal to 50 mg of the oral version.

As it has been said before, in our on-line store you have the opportunity to buy methandienone (dbol) both in oral and in injectable form.
